Senior engineer with 13+ years shipping production-grade web and mobile products across startups, scale-ups, and enterprise. I operate where complexity is the product: realtime pipelines, cross-platform state, mobile lifecycle, AI integrations, multi-team coordination.

As lead frontend on a healthcare AI app, I defined the architecture the team builds against, own the realtime audio and transcription pipeline end to end, and designed the session lifecycle and recovery flows that keep hours-long recordings intact through backgrounding, network loss, and the rest of mobile reality, work now running in live clinical environments where reliability is not optional.

Open to senior and staff-level remote roles where I contribute at the system level, not just feature delivery.

EXPERIENCE

Lead Frontend / TypeScript Engineer

Jul 2024 - Present

Remynd · Healthcare AI startup

Joined as lead frontend to take a healthcare AI mobile app from early-stage product into a reliable tool used by clinicians in live clinical settings. Own architectural direction for the React Native and Expo app, the realtime audio and transcription pipeline, and the session lifecycle that keeps long recordings intact through the messy realities of mobile use. Operate as the technical bridge across frontend, backend, and AI teams.

- React Native
- Expo
- TypeScript
- Kotlin
- Realtime audio
- WebSockets
- Turborepo
- AI integrations

- › Defined the frontend architecture and the patterns the team builds against, keeping the codebase modular as feature surface grew
- › Owned the **realtime audio capture and transcription pipeline** end to end, integrating external AI providers under production conditions
- › Designed a full **session lifecycle** (recording, upload, processing, recovery) built around an explicit state machine — so the app could reason about failure, not just experience it
- › Built recovery flows for interrupted recordings, persisting enough local state for recovery to be deterministic rather than hopeful; reduced clinician-visible session failure in production
- › Replaced critical recording components with **native Kotlin implementations** when React Native abstractions could not guarantee the OS-level behavior needed for reliable background audio capture
- › Introduced structured logging, telemetry, and diagnostics: a session failure went from an invisible event to a traceable one with a clear cause and, where possible, an automatic recovery path
- › Owned the monorepo structure (Turborepo): package boundaries, shared tooling, and the conventions that kept developer experience from degrading as the codebase grew
- › Mentored teammates on React Native patterns, mobile lifecycle handling, and cross-platform trade-offs

Senior TypeScript Developer

Jan 2023 - Jan 2024

INFORM GmbH · WorkforcePlus (AI workforce optimization)

Joined the team behind **WorkforcePlus**, INFORM's AI-powered workforce scheduling product used by KLM, LATAM, Lufthansa Technik, and large retail and service chains to optimize shifts under labor law, union agreements, and operational constraints. After ramping up on the core product (features and bug fixes on WorkforcePlus itself), I took ownership of the migration of the internal back-office tool — the surface where managers and customer admins configure the rules, base data, and constraints that feed the optimization engine — from a legacy stack to TypeScript and Next.js.

TypeScript Next.js React Node.js Enterprise

- › Owned the rebuild of the configuration back-office in a modern TypeScript and Next.js stack: a richly stateful, form-heavy surface where every input maps to a real-world scheduling rule that an airline or retailer depends on
- › Translated genuine domain complexity (working-time models, qualification matrices, multi-layered union and company agreements) into UX flows and API contracts that admins could actually operate without consulting a manual
- › First months on the team: shipped features and fixes directly on the WorkforcePlus product itself, building familiarity with the optimization model and its UX surface before owning the back-office rebuild
- › Served as the technical voice in planning and stakeholder conversations — shaping API contracts, migration scope, and delivery estimates from the engineering side
- › Established code review standards and test discipline that became the quality baseline the team moved forward with

Senior Frontend Developer

Jul 2021 - Dec 2022

Smart Consulting · Embedded at Evident (later acquired by Valtech)

Embedded full-time at Evident — a product engineering studio — leading the frontend architecture for the greenfield reimplementation of **Mazars Signals**, a B2B compliance and collaboration platform planned to scale across 90 countries. Analyzed the legacy stack (three coexisting Vue 2 + jQuery + Sitecore setups, no linting, no test discipline), authored the architecture proposal, made and defended the stack-level decisions, and led the rebuild through to handoff.

TypeScript Vue 3 Tailwind GraphQL Vite Atomic Design

- › Authored the full frontend architecture proposal: framework (Vue 3), bundler (Vite), API contract (GraphQL over REST), state, testing, i18n, authentication, build tooling — each decision documented with trade-offs and reasoning
- › Made and defended specific contested choices in writing — Tailwind over PostCSS + custom utilities (debated with the design lead), atomic design with a strict folder hierarchy, single-repo strategy — anchored in onboarding ease, standardization, and bundle-size targets
- › Drove the engineering hygiene the legacy project had lacked: naming conventions, linting and Prettier defaults, Husky pre-commit hooks, shared editor config, Azure-pipeline CI/CD, Storybook for component documentation
- › Designed the i18n strategy with internationalization concerns treated as day-one constraints rather than later phases: Vue-i18n with lazy-loaded translation modules per feature, RTL support, and bandwidth optimization for low-connectivity markets
- › Led the implementation through to handoff alongside backend, design, and stakeholders, on a self-organizing team across the full delivery cycle of the migration

Frontend Web Developer

Nov 2019 - Mar 2021

Brief Creatives · Digital agency

Led frontend delivery for websites and mobile apps serving consumer brands (including Bayer and Bepanthen), translating brand-critical design into flexible, maintainable tech that could age gracefully under long-term client care.

React.js Vue.js Ionic WordPress Shopify

- › Shipped branded websites and mobile apps across React, Vue, Ionic, WordPress, and Shopify
- › Balanced brand fidelity with pragmatic tech choices so solutions remained flexible and extensible
- › Collaborated closely with designers and account teams to keep projects on-brand and on-schedule

Full Stack Web Developer

Jan 2019 - Aug 2019

EYESO · Early-stage startup

Joined a small early-stage team building a marketplace and social platform from zero, connecting photographers and digital artists with brands commissioning commercial work. Shipped from first commits through public beta launch.

Vue.js

Symfony

SOLID

Agile

- › Worked across frontend and backend in Vue.js and Symfony, applying SOLID principles, modular design, and tested code
- › Helped shape product direction alongside founders and designers, with full ownership of the slice I owned
- › Built foundations the team could extend on as the product evolved past beta

Full Stack Web Developer

Apr 2018 - Dec 2018

COPYTRACK GmbH · Copyright enforcement SaaS

Contributed to a data-driven SaaS platform used by hundreds of thousands of users worldwide to detect stolen images and enforce copyright. Designed, built, and deployed user-facing flows into a production system with a large existing user base.

Symfony

PHP

MySQL

ElasticSearch

AWS

- › Led design and delivery of key flows: a new onboarding experience, a reworked profile area, and a redesigned dashboard
- › Built across the stack with ElasticSearch, PHP, Symfony, MySQL, deployed continuously on AWS
- › Wrote modular, clean, testable code designed to scale alongside a growing user base

EARLIER EXPERIENCE

- Full Stack Web Developer · Ótima Ideia (São Paulo agency)

Apr 2016 - Dec 2017
- E-commerce Web Developer · Allstore Shop

Apr 2015 - Jul 2016
- Freelance Web Developer · Catorze Digital

Jan 2013 - Apr 2015
